

A clinical research study for major depressive disorder (MDD)

If your current antidepressant medication(s) is/are not adequately improving symptoms of your MDD, you may be eligible for the AMPA-Vega 1 Study. This study is researching an investigational drug to see if it is safe and whether it improves symptoms of MDD when taken with your current antidepressant medication(s).

Participation in the study may exceed 24 months. The number of visits is related to the length of time you are in the study. All participants will be able to remain on their current antidepressant medication(s) while taking part. Reimbursement may be available for applicable travel costs and inconveniences.

TO PARTICIPATE IN THIS STUDY, YOU MUST:

- Be at least 18 years old
- Have a primary diagnosis of MDD
- Be currently receiving at least 1 antidepressant medication
- Have had inadequate response to up to 5 oral antidepressant medications
- Not be pregnant, breastfeeding, or planning to become pregnant during the study

There are additional eligibility requirements, which the study team can explain to you.

For more information, talk to your doctor
or visit AMPAProgram.com.

This program is committed to supporting diversity, equity, and inclusion in clinical research. It is important that studies include participants from many backgrounds in order to accurately reflect the patients that the research serves.
